Natural Gas

Short-term changes in demand or supply can cause significant price fluctuations, particularly during winter when infrastructure constraints and slow fuel switching can occur. Storage plays a crucial role in meeting peak demand and absorbing excess supply during low-demand periods. Storage volume typically increases from April to October and decreases from November to March to accommodate seasonal fluctuations in demand.

Weather

Weather impacts energy market prices through its influence on supply and demand dynamics as well as renewable energy generation. Extreme temperatures, severe weather events, and fluctuations in fuel availability can lead to changes in energy prices and overall market volatility.
