<b>Carbon Dioxide (CO<sub>2</sub>)</b>	740.27	This is 0.0% less than the New England Average
<b>Nitrogen Oxide (NO<sub>x</sub>)</b>	0.6548	This is 0.0% less than the New England Average
<b>Sulfur Dioxide (SO<sub>2</sub>)</b>	0.4041	This is 0.0% less than the New England Average

Notes: lbs/MWh = pounds per Megawatt-hour  
1 Megawatt-hour = 1,000 kilowatt-hours

**Additional Information and Required Notes:**

**Notes:**

**Power Sources** – Maine law requires retail electricity providers to periodically provide information to their customers on the mix of power sources used by the provider to serve their Maine customers' load.

**Emissions** – **Carbon Dioxide (CO<sub>2</sub>)** is released when certain fuels are burned. It is considered a greenhouse gas and a major contributor to global warming. **Nitrogen Oxides (NO<sub>x</sub>)** form when certain fuels are burned at high temperatures. They are considered contributors to acid rain and ground-level ozone (or smog). **Sulfur Dioxide (SO<sub>2</sub>)** is formed when fuels containing sulfur are burned. Major health effects associated with SO<sub>2</sub> include asthma, respiratory illness and aggravation of existing cardiovascular disease. The production of electricity can produce other harmful emissions and have other environmental impacts. Environmental impacts differ among individual power plants.
